MenuQr – Project Review & Changes Report

Generated: 7 Nov 2026

1. Project

Next.js 15 + Supabase restaurant QR menu (admin dashboard + public menu).

2. Issues found and fixed

- Build error: src/app/_not-found/page.tsx moved to src/app/not-found.tsx.
- Admin UI language was English-only; added EN/FR/AR switcher with RTL and persistence.
- Settings allowed unsupported content locales (en/es/de); restricted to fr/ar.
- Several hardcoded English strings in dashboard pages; migrated to i18n.
- Analytics page removed (route + sidebar entry).
- Settings simplified: removed images section and currency/language defaults.
- Menu table headers/buttons translated.

3. Admin language switching

Supported languages: English, Francais, Arabic. Choice saved in localStorage + cookie; updated; Arabic renders RTL. Initial language comes from the admin profile locale.

4. Database / Arabic support

Arabic names and descriptions are stored in the translations jsonb column (nameAr/descriptionAr merged via mergeTranslations). The schema already accepts UTF-8 text, so no migration was required.

5. Running the project

cd /Users/macbookpro/Desktop/MenuQr && npm run dev -> http://localhost:3000
